

Installing Guide

⑨ Rake or sweep up all the artificial grass remains

⑩ Infill silica sand (optional) and then rake or sweep

① Compact the sub base

⑧ Nail the grass into place

② Unroll the turf

⑦ Cut the artificial grass into the shape desired

③ Cut the edges

⑥ Press the artificial grass down & fix it

⑤ Distribute adhesive

④ Roll out the seam-tape

Daily Maintenance

Durability is the main core in designing artificial grass. Comparing with natural grass, synthetic grass needs no "rest". Appropriate maintenance aims to strengthen its practicability and improve its aesthetic character. The following tips will help you extend your artificial grass court life-span:

1. Basic point

It takes two weeks to stabilize grass fibers after installation. In the mean while, heavy apparatus and unnecessary cars should be prohibited avoid sports events, also reduce sweeping, no watering cleaning when the temperature is high.

2. Keep clean

Sweeping the lawn regularly is the only effective means to maintain the best performance. If it is used frequently, cleaning & maintenance once a month is highly recommended.

3. Provide adequate rubbish bins to avoid rubbish spilling onto grass.

4. It is a suitable time to check, fix and maintain an artificial grass court in the early spring.

5. Post logo of "No Smoking" and "No Food & Drinks" etc.

Transportation & Storage

Transportation

1. No blazing sun; no rain; free from damp, pollution and over squeezing.

2. Artificial grass may be folded or broken by incorrect transportation.

3. Fork-lift is suggested in loading and unloading the turf.

Storage

1. The warehouse should be aeration-drying, damp-proof and rainproof.

2. No pollution and over squeezing, away from fire, the ambient temperature > 40 °C.

3. The storage time should not exceed 1 year since the production finished date.
